The Linux Thai HOWTO

Poonlap Veeratanabutr, poon-v@fedu.uec.ac.jp

v0.4, 4 August 1998

This document describes how to use Thai language with Linux. This will cover setting Thai fonts, Thai keyboard and some Thai applications.

1. Introduction

It's about one year that I didn't update this document. There were a lot of movement in Thai computing and using Linux in Thailand. For example, Linux boxes are used as server in many [schools in Thailand](#).

The purpose of this document is to show how to set your Linux to use Thai language. I use Linux RedHat 5.0 as I wrote this document, so directories which I mention in this document may be different from other distribution.

First I would like to talk about Thai standard character set. Thai standard character set is TIS-620. There are also other Thai standard character sets such as ISO-IR-166, CP874, etc. Please see <http://www.inet.co.th/cyberclub/trin/thairef/> for further information about Thai standard character set. TIS-620 is 8-bit character set. It has the same range as ISO-8859-1, so we can use applications that support ISO-8859-1 character set also. Although we can use Thai language with applications that support ISO-8859-1 character set, but it does not mean those applications support Thai language.

Thai characters are different from English characters. There is a variation of position, normal position, character can be on other character, character can be under other character. There is no space between words. These are some problems in developing Thai supported application.

You can find the latest version of Thai-HOWTO document from <http://www.fedu.uec.ac.jp/ZzzThai/Linux>. Your comment is welcome.

2. Thai Input and Output

2.1 Linux console

Thai characters do not display properly in Linux console. If you mainly use X window, you may pass this section.

Thai fonts

You can obtain Linux Thai console fonts which created by Mr. [Phaisarn Techajaruwong](#) from [ZzzThai ftp site](#)

For example, there is a font name "phaisarn.psf". Put it in `/usr/lib/kbd/consolefonts/` directory. Then, you can load the new font from Linux console by command

```
%setfont phaisarn.psf
```

Keyboard layout

You can set keyboard behavior as you like by using `loadkeys` command. Usually, you use `loadkeys` to load the file located in `/usr/lib/kbd/keytables`. You can create a US/Thai keyboard-map file and save it in this directory. Here is a sample.

```

keycode 0 =
keycode 1 = Escape          Escape
      alt      keycode 1 = Meta_Escape
keycode 2 = +one            exclam      +0x0e5      plus
      alt      keycode 2 = Meta_one
      alt shift keycode 2 = Meta_exclam
keycode 3 = +two            at          +slash      0x0f1
      control keycode 3 = nul
      control shift keycode 3 = nul
      alt      keycode 3 = Meta_two
      alt shift keycode 3 = Meta_at
keycode 4 = +three          numbersign +underscore 0x0f2
      control keycode 4 = Escape
      alt      keycode 4 = Meta_three
      alt shift keycode 4 = Meta_numbersign

```

Suppose you save this file as `thai.map`. From Linux console, use command `loadkeys` to load `thai.map`.

```
%loadkeys thai.map
```

You can switch to Thai keyboard by pressing the right Alt key. If you want to switch the keyboard back, press the right Alt key again.

2.2 X Window system

Thai fonts

You can obtain Thai fonts in bdf format or pcf format from internet. You can also use scalable fonts such as Type1 or TrueType fonts. But I will not describe about these.

Installing Thai fonts

You must log in as root. Let's put Thai fonts in `/usr/X11R6/lib/X11/fonts/misc/`, this is a default font path. Change directory to `/usr/X11R6/lib/X11/fonts/misc/` and run command

```
%mkfontdir  
%xset fp rehash
```

If you put Thai fonts in different directory, you must use `xset` to add the new font path. Please see man-page for further information. You can check the new fonts by running command `xlsfonts` and see whether there are Thai fonts or not. If you can not see any Thai fonts from this command, you may need to restart X window.

Thai keyboard layout There are two ways to map Thai keyboard on X window, using X Keyboard Extension (XKB) and using `xmodmap`. Please select how you map Thai keyboard. I recommend using XKB.

XKB and Thai keyboard layout.

Beginning with XFree86 3.1.2D, you can use the new X11R6.1 XKEYBOARD extension to manage the keyboard layout. This is very helpful.

During X server configuration with `xf86config` you will be asked about XKB, if you want to set Thai keyboard layout for your system, say yes. There are a list of pre-configured keymaps. Choose Standard 101-key, Thai encoding.

`XF86Setup` is the graphical X server configuration utility for XFree86 X server. It is easier than traditional `xf86config`. You can select a keyboard layout easily with this tool.

There are many choices of keyboard switch key to select. The default is LeftAlt+RightShift switch to Thai and LeftAlt+LeftShift switch to US. You can type Thai characters in any applications which support ISO-8859-1 character set, but don't forget to use Thai fonts with those applications too.

I found that pre-configured keymaps that came with XFree86-3.2 is not correct. You may not be able to type THO THUNG which located at " 5 key ". To fix this problem, you should add the line

```
key <AE05> {      [], [ paragraph,      ocircumflex      ]      };
```

in the file `/usr/X11R6/lib/X11/xkb/symbols/th` as the example.

```
.....
key <AE03> {      [], [      minus,      ograve      ]      };
key <AE04> {      [], [      Agrave,      oacute      ]      };
key <AE05> {      [], [ paragraph,      ocircumflex      ]      };
key <AE06> {      [], [      Ooblique,      Ugrave      ]      };
key <AE07> {      [], [      Odiaeresis,      ssharp      ]      };
.....
```

You can not type SORUSI also. Please change the line from

```
key <AC08> {      [], [      Ograve,      eacute      ]      };
```

to

```
key <AC08> {      [], [      Ograve,      Eacute      ]      };
```

Note that `eacute` is equal to MAITHO and `Eacute` is equal to SORUSI.

There are also XKB extension utilities such as `setxkbmap`, `xkbcomp`, etc. Please see man-page for more

The Linux Thai HOWTO

information. I recommend to use `xkbvled`. The leds will be on when you are using Thai keyboard so you can know your keyboard's status.

The following is part of `XF86Config` file about keyboard section. If you want to configure the keyboard by hand, change the content of `/usr/X11R6/lib/X11/XF86Config` as an example below. This configuration uses the default toggle key.

```
Section "Keyboard"
    Protocol            "Standard"
    AutoRepeat          500 5
    LeftAlt             Meta
    RightAlt            Meta
    ScrollLock          Compose
    RightCtl            Control
#   XkbDisable
    XkbKeycodes         "xfree86"

    XkbModel            "pc101"
    XkbLayout          "th"
EndSection
```

If you use XKB extension, Thai keyboard mapping with `xmodmap` may not work. See `XF86Config` man-page for mor information.

Thai keyboard layout with `xmodmap`

You can use the utility `xmodmap` to map Thai keyboard. Normally `xmodmap` is used to load a keyboard configured file. For most Linux distributions, when you start X window with `startx`, X server will find `.Xmodmap` in `/usr/X11R6/lib/X11/xinit/` first. If `.Xmodmap` does not exist, X server will find `.Xmodmap` in your home directory. Please see the content of `/usr/X11R6/lib/X11/xinit/xinitrc`.

The following is the sample of `.Xmodmap` for Thai Kedmanee keyboard layout.

```
!
! Linux/XFree86 Thai Kedmanee layout (based on US keyboard)
! Use ScrollLock to switch to Thai keyboard.
! This file will work with XFree86 only.
!

clear Shift
clear Lock
clear Control
clear Mod1
clear Mod2
clear Mod3
clear Mod4
clear Mod5

add    Shift    = Shift_L Shift_R
add    Lock     = Caps_Lock
add    Control  = Control_L Control_R
add    Mod1     = Alt_L Alt_R
add    Mod2     = Mode_switch
```

Just put `.Xmodmap` in your home directory will be OK. When you start X window, X server will load this file.

You can also load `.Xmodmap` from command line.

```
%xmodmap ~/.Xmodmap
```

In above `.Xmodmap` file, US/Thai switch key is assigned to keycode 0x4E (78), Scroll Lock key, with the statement

```
keycode 0x4E = Mode_switch      XF86ModeLock
```

`XF86ModeLock` is the special keysym for XFree86 X server. If you don't add this keysym, you have to hold the scroll lock key while you are typing Thai characters. Note that if you use commercial X server, some keycodes are different. You may have to map keyboard by yourself. See man-pages of `x` and `xev` for further information.

Note: If you are using XFree86 version 3.1.2D or later, you need to add the line `XkbDisable` in keyboard section of `XF86Config` file. You may config the keyboard section like the following sample.

```
Section "Keyboard"
    Protocol      "Standard"
    AutoRepeat    500 5
    LeftAlt       Meta
    RightAlt      ModeShift
    ScrollLock    ModeLock
    RightCtl      Compose
    XkbDisable
EndSection
```

3. Applications with Thai language

This is the tricky part. Most applications support ISO-8859-1 character set. For example, emacs can display ISO-8859-1 character. If we set emacs to display ISO-8859-1 and use Thai font, you can edit Thai document with emacs. But this is not a good policy. You should avoid using this trick as possible. What we need is Thai locale or Thai supported applications to manage these things.

To make X window application displays Thai font, you should run the application with `-fn` option. For example,

```
%xedit -fn thai8x16
```

Note that `thai8x16` is just a one of Thai font names. You can see all available fonts by command `xlfonts`. If you don't want to fill `-fn` option every time you run application. You should set Thai font in your `~/.Xdefaults` or `~/.Xresources` like this

```
XTerm*font:      thai8x16
```

3.1 Some X applications and Thai language

txterm

`txterm` is Thai version of `xterm`. There are several programs running under `xterm` such as `shell`, `pine`, `vi`, `less`, etc. We can type Thai characters without any problems with `txterm`. `Txterm` also provides its own Thai input method by pressing " F1 " key. `Txterm` will use fonts `thai9x13` as default Thai font. You can change this by add `-fn` option.

You can get `txterm` from [Thaigate](#) or [ZzzThai](#).

bash shell :

Normally, shell accepts only ASCII character set. To type Thai characters in shell command line, you should set environment `LC_CTYPE` to `iso_8859_1`.

I don't set `LC_CTYPE` environment variable to `iso_8859_1` because this environment variable will effect other applications too. With bash shell, you can specify which environment variable to be passed to the application. For example, I can make a fake Thai X terminal with this syntax.

```
LC_CTYPE=iso_8859_1 xterm -fn thai8x16
```

The Linux Thai HOWTO

This xterm display Thai characters well, but not good for typing Thai characters. I strongly recommend you to use `txterm`.

ls :

If you name a filename in Thai. Issue the command as

```
ls -N
```

You may set `alias` in `~/.bashrc` or `~/.cshrc`, so you can type `ls` without option. If you don't use `ls` with `-N` option, you may see Thai filename as `?????`.

Emacs, Mule

Mule stands for " Multilingual Enhancement to GNU Emacs ". It has the same functions as emacs and supports many languages. Mule provides its own input method, so you don't need any configuration for typing Thai. You needs only Thai fonts for mule which you can get from, [ZzzThai](#) or [Etl site](#). These Thai fonts are fixed width fonts.

You need some configuration for mule. Puts the following lines in your `.emacs`.

```
;;  
;; Thai System, add in .emacs  
;;  
(set-file-coding-system-for-read '*tis620*)  
(set-default-file-coding-system '*tis620*)  
(set-display-coding-system '*tis620*)  
(set-keyboard-coding-system '*tis620*)  
(setq-deafault quail-current-package (assoc "thai" quail-package-alist))
```

Add the following lines in `.Xdefaults`.

```
!  
! Emacs, Mule - Font menu  
!  
Emacs*FontSetList: thai14, thai16, thai24  
Emacs*FontSet-thai14:\n    -etl-fixed-medium-r-normal--14-140-72-72-m-70-tis620.2529-1  
Emacs*FontSet-thai16:\n    -etl-fixed-medium-r-normal--16-160-72-72-m-80-tis620.2529-1  
Emacs*FontSet-thai24:\n    -etl-fixed-medium-r-normal--24-500-72-72-m-120-tis620.2529-1
```

When you hold shift key and press left mouse's button, you can select Thai fonts to display in mule window. To type Thai characters, press " Ctrl +] ". To type English, press " Ctrl +] " again.

You can get mule from [ElectroTechnical Laboratory\(ETL\)](#)

vi

Vi should be run on `txterm`.

pine

In the past, we could not send 8-bit characters through E-mail. Now, although mail transfer agent can handle

The Linux Thai HOWTO

8-bit characters but some old mail transfer agent can not. We can send Thai e-mail by using e-mail application that supports MIME (Multipurpose Internet Mail Extensions) E-mail applications that support MIME are pine, elm, Netscape mail, etc.

Put the following definition in your `~/.pinerc` file:

```
character-set=ISO-8859-1
```

This can also be set via the `Setup` option in pine window. You can find it under `Config`. You can read Thai news from pine, too.

Pine should be run in `txterm`.

Netscape

If you have Thai fonts in your system. Just set Thai font from preference. Thai fonts will appear in User defined area. See <http://www.fedu.uec.ac.jp/ZzzThai/unix> for setting Thai language on Netscape.

Some movement about Thai Mozilla project at <http://members.xoom.com/inThai/mozthai.html>.

Ss, Simple thai word Separator

`ss` is a dictionary based Thai word separation program similar to `cttex`. It can be used to insert a configurable string between Thai words. It can also show words that cannot be found in the dictionary. More words can be added to the dictionary. Developed by Mr.Teera Kittichareonpot.

We can use this program to insert `< WBR >` tag between Thai words in html file. Browser will display Thai homepage better than normal html document.

Xzthai, X keyboard configurator + simple editor

`Xzthai`, this is the Tcl/Tk application for mapping Thai keyboard on any keyboard with graphical user interface. Also provides simple editor and keyboard layout figure. It actually uses `xmodmap` program in background to map Thai keyboard. This may be useful for commercial X server and X server on UNIX.

3.2 Printing Thai document

`Thai2ps` is used to convert plain text file to postscript file. You can use `ghostscript(gs)` to print your Thai document. For better quality document, you have to use (La)TeX.

Latex and Thai language

Dr. Manop Wongsaisuwan first tried to use Thai language with `latex`. He wrote some perl script as filter for latex source code that contains Thai language. Then pass the result to `latex`. Mr. Vuthichai Ampornaramvech used this concept and wrote a program in C language, `cttex`, to handle this. It runs faster and makes Thai word segmentation based on dictionary. `cttex` also fixes the position of Thai characters in word, so SARA and WANNAYUK will be placed in the beautiful position.

You can find Thai latex filter from <http://thaigate.nacsis.ac.jp/files/ttex.html>.

Latex's configuration for Thai language

You must have `latex` installed in your computer. First, download Thai postscript (Type1) fonts, tfm fonts and Thai style file. These fonts are needed by `Latex`. This is the list of files you should download.

```
tfm fonts:
    dbtt.tfm      dbttb.tfm      dbttbi.tfm  dbtti.tfm
postscript fonts:
    dbtt.pfa      dbttb.pfa      dbttbi.pfa  dbtti.pfa
style files:
    thai.sty sakka.sty
Thai Latex filter:
    cttex
Sample Latex file:
    ttex.ttex test.ttex
```

There is `latex`'s directory at `/usr/lib/texmf/texmf/` (RedHat 5.0). I will call `/usr/lib/texmf/texmf/` as "`$texroot`". We will concentrate at `$texroot/texmf/` directory. In `$texroot/texmf/` directory, there are many files about `tex`'s configuration. You have to edit files in `dvips`, `fonts`, `tex` subdirectories.

Add the following lines to `$texroot/texmf/dvips/misc/psfonts.map`

```
dbtt  DBThaiText <dbtt.pfa
dbttb DBThaiTextBold <dbttb.pfa
dbttbi DBThaiTextBoldItalic <dbttbi.pfa
dbtti DBThaiTextItalic <dbtti.pfa
```

Make a new directories and copy files to the appropriate directories.

```
%mkdir /usr/lib/texmf/texmf/fonts/tfm/public/thai
%mkdir /usr/lib/texmf/texmf/fonts/type1/public/thai
%mkdir /usr/lib/texmf/texmf/tex/generic/thai
%cp *.tfm /usr/lib/texmf/texmf/fonts/tfm/public/thai
%cp *.pfa /usr/lib/texmf/texmf/fonts/type1/public/thai
%cp *.sty /usr/lib/texmf/texmf/tex/generic/thai
```

Run `texhash` or `MakeTeXls-R`(in some system) to update `Tex` database.

```
%/usr/bin/texhash
texhash: updating /usr/lib/texmf/texmf/ls-R ...
texhash: Done.
```

Use Thai `LaTeX` filter

We can use `cttex` as filter like this,

```
%cttex < ttex.ttex > ttex.tex
C-TTeX $Revision: 1.15 $
Usage : cttex [cutcode] < infile > outfile
Usage : cutcode=0 forces operation in HTML mode.
Build-in dictionary size: 9945 words
    343
Done
%latex ttex.tex
...
%xdvi ttex.dvi
```

You can convert dvi file to postscript file by,

```
%dvips -o ttex.ps ttex.dvi
```

Finally, you can print ttex.ps by using `gs` or `lpr`. You must configure printer before printing. See man-pages of `printcap`, `gs`, `lpr` for more information.

Editing LaTeX source file

For new latex user, `lyx` is helpful. But I recommend to use `mule` to edit Thai latex source file because `mule` supports Thai language and it is a powerful editor. You may take a look a [Thai Latex tutorial](#).

3.3 X Application Resources

Because Xt based applications allow user to configure the applications by resources. We can make the menu or label to be Thai language.

For example, if you want `xman` to display Thai labels. You may add these lines in your `.Xdefaults`

```
.....
!! Xman section
Xman*Font:                                thai8x16
Xman*helpButton.Label:                    ^èÇÂ
Xman*quitButton.Label:                    íí;
Xman*manpageButton.Label:                 ¢ÛèÁ×í;ÒÃã^é
.....
```

You can use the same idea to set window manager to be more Thai environment too.

3.4 Thai Extension for Linux (TE)

Thai Extension for Linux is a installation package comes with applicaions and Thai fonts. You don't have to configure Linux system and applications by yourself. Let TE do configuration task for you. After installation, you can use Thai language suddenly. Get TE from <ftp://fedu.uec.ac.jp/pub/thai/UEC/ZzzThai/Software/Linux/>
